2/22/2021

1. Let X be generated by the following random coefficients discrete choice model $X = 1\{-U_0 + ZU_1 > 0\}$ where $U = (U_0, U_1)'$ is independent of Z and $Z \in \{0, 1\}$. Provide conditions on U such that $Pr(Defying) = 0$ and $Pr(Complying) > 0$.

$Pr(Defying) = 0$ iff $X_U(1) = 0 \implies X_U(0) = 0$ and $X_U(0) = 1 \implies X_U(1) = 1$. $X_U(1) = 0 \implies X_U(0) = 0$ iff $-U_0 + (1)U_1 = -U_0 + U_1 < 0 \implies -U_0 + (0)U_1 = -U_0 < 0$. $X_U(0) = 1 \implies X_U(1) = 1$ iff $-U_0 + (0)U_1 = -U_0 > 0 \implies -U_0 + (1)U_1 = -U_0 + U_1 > 0$. Thus, $U_1 \geq 0$.

$Pr(Complying) > 0 \iff Pr(X_U(1) = 1 \text{ and } X_U(0) = 0) > 0$. Since $U_1 \geq 0$, this implies that $U_1 > U_0 \geq 0$.

2. Let $\{Y_t\}_{t=1}^T$ be generated by the following MA(q) model, i.e., $Y_t = \mu + \varepsilon_t + \theta_1 \varepsilon_{t-1} + ... + \theta_q \varepsilon_{t-q}$ where $\{\varepsilon_t\}_{t=0}^T$ are i.i.d. random variables with mean zero and variance σ^2.

(i) Find the autocovariance function $\gamma(k)$.

For $k = 1$:

$$\begin{aligned}
\gamma(1) &= Cov(Y_t, Y_{t+1}) \\
&= Cov(\mu + \varepsilon_t + \theta_1 \varepsilon_{t-1} + ... + \theta_q \varepsilon_{t-q}, \mu + \varepsilon_{t+1} + \theta_1 \varepsilon_{t+1-1} + ... + \theta_q \varepsilon_{t+1-q}) \\
&= Cov(\varepsilon_t + \theta_1 \varepsilon_{t-1} + ... + \theta_q \varepsilon_{t-q}, \varepsilon_{t+1} + \theta_1 \varepsilon_t + ... + \theta_q \varepsilon_{t+1-q}) \\
&= Cov(\varepsilon_t + \theta_1 \varepsilon_{t-1} + ... + \theta_{q-1} \varepsilon_{t+1-q}, \theta_1 \varepsilon_t + ... + \theta_q \varepsilon_{t+1-q}) \\
&= \theta_1 Var(\varepsilon_t) + \theta_1 \theta_2 Var(\varepsilon_{t-1}) + ... + \theta_{q-1} \theta_q Var(\varepsilon_{t+1-q}) \\
&= \sigma^2 (\theta_1 + \theta_1 \theta_2 + ... + \theta_{q-1} \theta_q)
\end{aligned}$$

For general k:

$$\gamma(k) = \begin{cases} \sigma^2 (\theta_k + \theta_1 \theta_{k+1} + \theta_2 \theta_{k+1} + ... + \theta_{q-k} \theta_q), \text{ if } k \leq q \\ 0, \text{ if } k > q \end{cases}$$

(ii) Suppose that $q = 1$ and find the autocorrelation function, $\rho(k) = \frac{\gamma(k)}{\gamma(0)}$.

If $q = 1$:

$$Y_t = \mu + \varepsilon_t + \theta_1 \varepsilon_{t-1}$$

$\gamma(k)$ simplies to

...

(iii) Is θ_1 identified from the autocorrelation function?

*I worked on this problem set with a study group of Michael Nattinger, Andrew Smith, and Ryan Mather. I also discussed problems with Sarah Bass, Emily Case, Danny Edgel, and Katherine Kwok.

...

(iv) Suppose $\theta_1 \in [-1, 1]$. Does you answer to (iii) change?

...

3. Consider an ARMA(1,1) model: $Y_t = \alpha_0 + Y_{t-1}\rho + U_t$ and $U_t = \varepsilon_t + \theta\varepsilon_{t-1}$ for all $t = 1, ..., T$; $Y_0 = \mu + \varepsilon_0 + \nu$ where $|\rho| < 1$, $|\theta| \leq 1$, $\varepsilon_0, ..., \varepsilon_T$ are idd $N(0, \sigma^2)$ and independent of $\nu \sim N(0, \tau)$.

(i) Find μ and τ (as functions of α_0, ρ, θ, and/or σ^2) such that $E[Y_t]$ and $Var(Y_t)$ does not depend on t.

...

(ii) For the μ and τ found above, you may use without proof that $\{Y_t\}_{t=1}^{T}$ is covariance stationary. Under what conditions on α_0, ρ, θ, and/or σ^2 is $(1, Y_{t-2})$ a valid instrument for $(1, Y_{t-1})$.

...
