ECON 710A - Problem Set 5

Alex von Hafften*

3/1/2021

- 1. Suppose that $\{\varepsilon_t\}_{t=0}^T$ are iid random variables with mean zero, variance σ^2 and $E[\varepsilon_t^8] < \infty$. Let $U_t = \varepsilon_t \varepsilon_{t-1}$, $W_t = \varepsilon_t \varepsilon_0$, and $V_t = \varepsilon_t^2 \varepsilon_{t-1}$ where t = 1, ..., T.
- (i) Show that $\{U_t\}_{t=1}^T$, $\{W_t\}_{t=1}^T$, and $\{V_t\}_{t=1}^T$ are covariance stationary.

For each time series, we check that (1) the second moment is finite, (2) the mean does not depend on t, and (3) the variance does not depend on t.

 $\{U_t\}_{t=1}^T$: For (1), because $E[\varepsilon_t^8] < \infty$ and ε_t are iid,

$$E[U_t^2] = E[(\varepsilon_t \varepsilon_{t-1})^2] = E[\varepsilon_t^2 \varepsilon_{t-1}^2] = E[\varepsilon_t^2] E[\varepsilon_{t-1}^2] = E[\varepsilon_t^2]^2 < \infty$$

For (2),

$$E[U_t] = E[\varepsilon_t \varepsilon_{t-1}] = E[\varepsilon_t] E[\varepsilon_{t-1}] = 0$$

For (3),

$$\gamma(0) = Cov(U_t, U_t) = Var(U_t) = Var(\varepsilon_t \varepsilon_{t-1}) = Var(\varepsilon_t)Var(\varepsilon_{t-1}) = \sigma^4$$

$$\gamma(1) = Cov(U_t, U_{t+1}) = E[U_t U_{t+1}] = E[(\varepsilon_t \varepsilon_{t-1})(\varepsilon_{t+1} \varepsilon_t)] = E[\varepsilon_t^2] E[\varepsilon_{t-1}] E[\varepsilon_{t+1}] = 0$$

$$\gamma(2) = Cov(U_t, U_{t+2}) = E[U_t U_{t+2}] = E[(\varepsilon_t \varepsilon_{t-1})(\varepsilon_{t+2} \varepsilon_{t+1})] = E[\varepsilon_{t-1}] E[\varepsilon_t] E[\varepsilon_{t+1}] E[\varepsilon_{t+2}] = 0$$

Thus, $\gamma(k) = \sigma^4$ if k = 0 and zero otherwise.

 $\{W_t\}_{t=1}^T$:

 $\{V_t\}_{t=1}^T$:

- (ii) Argue that the following three sample means $\bar{U}, \bar{W}, \bar{V}$ converge in probability to their expectations.
- (iii) Determine whether the following three sample second moments $\hat{\gamma}_U(0) = \frac{1}{T} \sum_{t=1}^T U_t^2$, $\hat{\gamma}_W(0) = \frac{1}{T} \sum_{t=1}^T W_t^2$, and $\hat{\gamma}_V(0) = \frac{1}{T} \sum_{t=1}^T V_t^2$ converge in probability to their expectations.
- (iv) Determine whether the scaled sample means $\sqrt{T}\bar{U}, \sqrt{T}\bar{W}, \text{ and } \sqrt{T}\bar{V}$ are asymptotically normal.

^{*}I worked on this problem set with a study group of Michael Nattinger, Andrew Smith, and Ryan Mather. I also discussed problems with Sarah Bass, Emily Case, Danny Edgel, and Katherine Kwok.

2. Consider a time series of length T from the model

$$Y_t = \alpha_0 + t\beta_0 + X_t \delta_0 + Y_{t-1} \rho_1 + U_t$$

where Y_0 and $\{U_t\}_{t=1}^T$ are iid N(0,1), and

$$X_t = X_{t-1} \cdot 0.3 + V_t$$

where X_0 and $\{V_t\}_{t=1}^T$ are iid N(0,1) and independent of Y_0 and $\{U_t\}_{t=1}^T$. We will let $\alpha_0 = \delta_0 = 100$, $\beta_0 = 1$ and consider all combinations of $T \in \{50, 150, 250\}$ and $\rho_1 \in \{0.7, 0.9, 0.95\}$.

(i) In a statistical software of your choice, generate data from (1), estimate the coefficients by OLS, and calculate heteroscedasticity robust two-sided 95% confidence intervals for α_0 , δ_0 , and ρ_1 .

```
tees <-c(50, 150, 250)
rhos \leftarrow c(0.7, 0.9, 0.95)
alpha <- 100
delta <- 100
beta <- 1
results <- NULL
for (t in tees) {
  for (rho in rhos) {

(iii) How does sample size and the degree of persistence in Y_t affect the results of the simulations.

The three figures below have the point estimate (dots) and confidence intervals (vertical lines) from part i (red) and part ii (blue) where panels differ by sample size (horizontal) and degree of persistence (vertical). The point estimate for part i is the OLS estimate based on a single trial of simulated data and the confidence interval is the heteroskedastic robust standard error. The point estimate for part ii is the mean of OLS estimates over 10,000 trials of simulated data and the confidence interval is the 5th and 95th percentile. Naturally, the point estimates from part ii are closer to the true value than the point estimates from part i. In addition, large sample sizes result in point estimates that are closer to the true value and tighter confidence intervals. For β , we see that higher degrees of persistence dramatically expand confidence intervals particularly for small samples. For δ and α , we that the confidence intervals are similarly sized across degrees of persistence and shrink with larger samples.
